DIY Greenhouse

By Dante Coco

First Step The Base

- To start off the green house you are going to create a base using wood and landscape fabric underneath, so no weeds grow up. After the base is complete you fill with dirt and move on to the next step

- Next You are going to attach pcp pipe connecting on both sides so you can put on the plastic tarp you can attach it using clamps or what I did just stick both sides into the ground
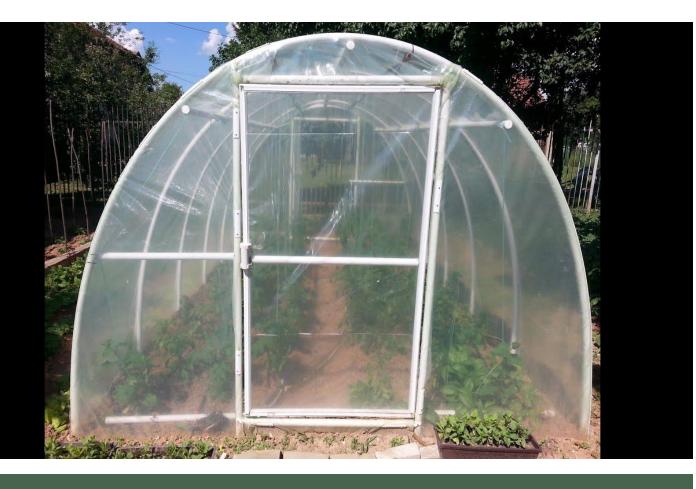

Step #2 putting up pcp pipes

- Next you are going to want to create a door so that the heat stays in for this build a frame using wood then for the door you can go the extra step and put in a real door or do what I did and just attach plastic tarp to cover the door

Step #3 Building the door

Step #4 putting on the plastic tarp

- For this step you are going to want to get plastic tarp that goes around the the whole area so that it all seals and there are no gaps and to actually attach it you are going to need to pull the plastic down to the wood base and then get a wood strip and nail the wood piece to the other wood piece trapping the plastic wrap and making it tight you will want to do it on all sides

- Once the green house is built and sturdy now you can go in and plant whatever you want to plant flowers vegetables etc.

Step#5 planting what you want to plant

Why is this helpful for our environment?

- Building a greenhouse or even just a regular garden help the environment because you can plant grow and eat what you grow. It also uses less energy and has less waste. It is also good considering the pandemic we are facing if you can grow your own vegetables means less trips to the grocery store and a source of healthy food.
